

5. (Currently Amended) A centrifugal blower assembly as set forth in Claim 1 ~~2~~, wherein the axial dimension of at least one of said at least two scroll sub-sections varies as the air proceeds from the impeller to an associated discharge opening.
6. (Original) A Centrifugal blower assembly as set forth in Claim 5, wherein the manner in which the axial dimensions of said two sub-sections varies is different.
7. (Currently Amended) A centrifugal blower assembly as set forth in Claim 1 ~~2~~, wherein the centerlines of the flows through the sub-sections differ.
8. (Original) A centrifugal blower assembly as set forth in Claim 4, wherein ~~the~~ discharge openings of the two sub-sections are substantially rectangular in cross section and are arranged in a adjacent end-to-end relationship to provide an elongated discharge opening.
9. (Original) A centrifugal blower assembly as set forth in Claim 4, wherein ~~the~~ discharge openings of the two sub-sections are arranged in adjacent side-by-side relationship to provide an aggregate discharge opening of substantially enlarged width.
10. (Original) A centrifugal blower assembly as set forth in Claim 4, wherein ~~the~~ discharge openings of the two sub-sections are arranged in angularly spaced apart relationship.
11. (Original) A centrifugal blower assembly as set forth in Claim 8, wherein the scroll sub-sections are configured with varying axial dimensions and at least one sub-section is displaced axially as it approaches its discharge opening to provide for an aggregate elongated discharge opening having substantially a common longitudinal centerline.
12. (Currently Amended) A centrifugal blower assembly as set forth in Claim 1 ~~2~~, wherein said at least two scroll sub-sections have cut-off points substantially at the same point circumferentially along the periphery of the impeller opening in the partition.
13. (Currently Amended) A centrifugal blower assembly as set forth in Claim 1 ~~2~~, wherein said at least two scroll sub-sections have cut-off points spaced circumferentially from each other.

14. (Currently Amended) A centrifugal blower assembly as set forth in Claim 1 ~~2~~, wherein said at least two scroll sub-sections have discharge openings with substantially parallel centerlines.
15. (Currently Amended) A centrifugal blower assembly as set forth in Claim 1 ~~2~~, wherein said at least two scroll sub-sections have discharge openings with centerlines angularly related to each other.
16. (Original) A centrifugal blower assembly as set forth in Claim 1, wherein said edge of said inner opening in said partition takes a thin rounded configuration facing the impeller.
17. (Original) A centrifugal blower assembly as set forth in Claim 16, wherein said edge is inclined gradually outwardly on opposite sides from said rounded configuration to the full thickness of the partition.
18. Cancel
19. Cancel
20. Cancel
21. (Original) A centrifugal blower assembly as set forth in Claim 1, wherein a flow balancing restriction is incorporated in at least one of said scroll sub-sections.

#### REMARKS

In reference to drawing objections, the features described in claim 5 and claim 6 are shown in figures 7 and 8. Numbers 32 and 34 were intended to show the axial dimension variation of each scroll sub-section and the different degree of axial variation between each scroll sub-section. Figures 7 and 8 are described in paragraph 4 of "Description of the Preferred Embodiments of the Invention". Provisional drawing changes are enclosed which address the issues with Figure 1 and Figure 3.

In reference to specification objections, the objection to claim 20 is deemed moot in view of the proposed claim cancellation listed above.
